Product Name: USAF 1951 Chart (Standard Layout)
Drawing / Photo of Part:

The above image is an approximate representation of the actual product. Specifications are subject to change without notice.

Description: This test target meets requirements as specified in MIL-STD-150A for resolving power tests. The target consists of a series of Elements having two sets of lines at right angles. Each set of lines consists of three lines separated by spaces equal to the line width. Each bar has a length to width ratio of 5:1. (Line width is equal to one half of line pitch, which is the inverse of line frequency.) Elements are arranged in groups of six each and Groups are arranged in pairs. Even numbered Groups occupy the left side and bottom right corner and contain a square feature having and edge length equal to the line length of Element 2 in that group. Odd numbered Groups occupy the top right corner and side. Groups and

[^0]| 1653 East Main Street <br> Rochester, NY 14609 USA <br> Voice: 585.482.0300 <br> FAX: 585.288.5989 <br> imaging@appliedimage.com | T-20 <br> USAF 1951 Chart Standard Layout Product Specifications | APPLIED IMAGE Inc |
| :---: | :---: | :---: |

Elements are labeled and differentiated by numbering adjacent to their features. Frequencies in cycles $/ \mathrm{mm}(\mathrm{c} / \mathrm{mm}$ ) increase between each Element by the sixth root of two (approximately $12.25 \%$ per step). The general formula for the line frequency of any target Element can be expressed as $2^{\text {Group+(Element-1)/6 }}$.

Note: Applied Image offers two improved versions of this test target as T-21 and T-22. These are labeled directly in $\mathrm{c} / \mathrm{mm}$ to obsolete the frequency look-up chart as well as other indicator and layout improvements.

Substrate Size, Type, Image Forming Material, Polarity and Frequency Range:

| Part Number | Substrate <br> Size (mm) | Substrate Type | Image Forming Material | Polarity | Frequencies (c/mm) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| T-20-N-CG | $102 \times 102$ | Soda-lime glass | Chrome | Negative | $0.25 \rightarrow 228$ |
| T-20-P-CG | $102 \times 102$ | Soda-lime glass | Chrome | Positive | $0.25 \rightarrow 228$ |
| T-20-N-OP | $102 \times 102$ | White opal glass | Chrome | Negative | $0.25 \rightarrow 228$ |
| T-20-P-OP | $102 \times 102$ | White opal glass | Chrome | Positive | $0.25 \rightarrow 228$ |
| T-20-2-N-CG | $102 \times 102$ | Soda-lime glass | Chrome | Negative | $0.25 \rightarrow 512$ |
| T-20-2-N-OP | $102 \times 102$ | White opal glass | Chrome | Negative | $0.25 \rightarrow 512$ |
| T-20-N-TM | $102 \times 102$ | Clear polyester | Photo-emulsion | Negative | $0.25 \rightarrow 181$ |
| T-20-P-TM | $102 \times 102$ | Clear polyester | Photo-emulsion | Positive | $0.25 \rightarrow 181$ |
| T-20-N-RM | $102 \times 102$ | Photo-paper | Photo-emulsion | Negative | $0.25 \rightarrow 22.6$ |
| T-20-P-RM | $102 \times 102$ | Photo-paper | Photo-emulsion | Positive | $0.25 \rightarrow 22.6$ |
| T-20-M-P-RM | $305 \times 305$ | Photo-paper | Photo-emulsion | Positive | $0.0625 \rightarrow 3.56$ |
| T-20-L-P-RM | $1016 \times 940$ | Photo-paper | Photo-emulsion | Positive | $0.0156 \rightarrow 3.56$ |

Reading Direction: Right Read Chrome / Emulsion Up (RRCU / RREU).
Image Placement Accuracy: $0.001 \mathrm{~mm} / 100 \mathrm{~mm}$ on glass. Polyester or paper expansion is the major source of change in photo-emulsion versions.

Feature Size Accuracy: Typical line width is 2 to 5 percent of aim.
Image Contrast / Density: Chrome transmission density is 2.0 or higher; photoemulsion transmission density 2.0 or higher (photo-emulsion on polyester); emulsion reflection density 1.3 or higher (photo-emulsion on paper).

History / typical use: Checking of optical resolving power for optical systems.
How to determine Group and Element size: With this version of the T-20 (original layout USAF-1951) chart, a look up table is needed. The chart is composed of

[^1]| 1653 East Main Street <br> Rochester, NY 14609 USA <br> Voice: 585.482.0300 <br> FAX: 585.288.5989 <br> imaging@appliedimage.com | USAF 1951 Chart <br> Standard Layout <br> Product Specifications | APPLIED <br> IMAGE Inc |
| :---: | :---: | :---: |

GROUPs of six ELEMENTs (an element is 3 horizontal bars and 3 verticle bars of the same size). Groups are labeled with such numbers as; $-6,-2,0,1,2,3$. Elements are labeled 1 through 6 . To tell what the resolution of an element is, note the number next to the bars (it will be 1 through 6). Then determine the group number by looking for the group number near element 1 of that group. The chart at the end of this document shows the resolution (at the chart) in cycles $/ \mathrm{mm}$ and other

How To Use Resolution Test Charts: Multi-bar test charts are most often used to determine the overall resolution limit of an entire optical system. Each component of a system adds some degradation to image quality. Therefore, the comparison of a test chart in the object plane to the resulting image (image plane vs. film or image vs. electronic file) will produce the complete account of all components such as optics, image processing, vibration, color fringing, etc. Test charts may be used in optical systems that reduce, maintain (the same image size 1:1) or magnify the image size however; system magnification must be applied as a multiplier to determine the resolving power limit. Example: To evaluate a 35 mm film-camera system, load the camera with the film of interest. Position the camera at a measured distance from the test chart and achieve good focus. (Commonly 25 focal lengths is the distance used from camera to the test chart.) Develop the image and measure the object and image sizes. (i.e. If the test chart card is 100 mm wide in the object plane and 5.5 mm on the film, the system reduction factor is 1:18.18 (0.055). Next, examine the film image using a microscope and determine the resolution limit. If the last distinct Element has a frequency of $5.04 \mathrm{c} / \mathrm{mm}$, then the resolving power or the resolution of the film is calculated from that image frequency divided by the reduction (5.04/0.055 or $91.6 \mathrm{c} / \mathrm{mm}$ ).

How to read a resolution bar test pattern: Resolution is defined as a threshold measurement. The resolution limit is the last group of bars that can be seen and correctly counted in both horizontal and vertical directions. Breaks within the bar pattern are acceptable, and do not cause failure of resolution as long as the bars are distinctly identified and accurately counted. A microscope with the necessary magnification is commonly used to view reduced images. The correct number of bars must be counted when determining the resolution limit in order to avoid an inflated measure. This problem can be seen while observing increasingly finer groups. Features will be beyond resolution and then appear again. One cause of

[^2]| 1653 East Main Street <br> Rochester, NY 14609 USA <br> Voice: 585.482.0300 <br> FAX: 585.288.5989 <br> imaging@appliedimage.com | T-20 <br> USAF 1951 Chart Standard Layout Product Specifications | APPLIED IMAGE Inc |
| :---: | :---: | :---: |

this spurious resolution is poor focus of a lens, which causes the bars and spaces in the image to apparently flip polarity. Other causes are artifacts from digital scanning, or image processing algorithms.

Target Viewing Angle: Test charts may be placed at the center and outer edges of the field of view so that the comparisons can be made of resolving power between locations across the field of view. Commonly, a comparison is made between center and edge at 90 -degree increments at the outer edge of the field of view. This is useful for detection of directional vibration influences and the common problem of uniformity of quality throughout the lens field of view. A more complete assessment would use charts at additional locations throughout the field for example, comparing resolving power at the center with the entire outside edge at 45-degree increments.

Terms: Line pairs per mm (LP/mm) or Lines per mm (lpmm) equals cycles per mm .

How to determine Group and Element size: With this version of the T-20 (original layout USAF-1951) chart, a look up table is needed. (all this look-up can be avoided by use of the T-21 or T-22 charts, which are labled in cycles $/ \mathrm{mm}$ ). The chart is composed of GROUPs of six ELEMENTs (an element is 3 horizontal bars and 3 verticle bars of the same size). Groups are labeled with such numbers as; $-6,-2,0,1,2,3$. Elements are labeled 1 through 6 . To tell what the resolution of an element is, note the number next to the bars (it will be 1 through 6). Then determine the group number by looking for the group number near element 1 of that group. The chart at the end of this document shows the resolution (at the chart) in cycles/mm and other

## 1951 USAF Resolution Test Pattern - Group \& Element Labels

Resolution features of the 1951 USAF Resolution Target are arranged in elements and groups. Each Element is made up of equally spaced bars; three horizontal and three vertical. Groups consist of six elements labeled 1 through 6 . Groups are labeled by number in order of increasing frequency.

The figure above shows the location of groups and elements. Note that Element 1 of even numbered Groups is placed in the lower right corner and diagonally opposite Element 2 of the same Group. With this exception, all Elements are arranged in ascending order from top bottom.

The resolution limit of a system is found by examining an image of the resolution test target to locate the Element of highest frequency where either horizontal or vertical lines are not indistinct. Note that the horizontal limit of resolution may indicate a different frequency than the limit of vertical resolution.
